

Advanced Filtering Module

The Advanced Filtering Module enables users to efficiently narrow down car options based on their specific preferences. This module improves user experience by reducing the time required to search through large sets of car data. Users can apply filters such as brand, price range, fuel type, and body type (SUV, Sedan, Hatchback). The system dynamically updates the car list based on selected filters, allowing users to quickly find suitable options. The filtering process is designed to be fast and responsive, ensuring real-time updates without reloading the page. This is achieved through efficient frontend-backend communication and optimized database queries. The module integrates seamlessly with the car database and recommendation system, ensuring that filtered results are accurate and relevant. It also supports multiple filters applied simultaneously, providing flexibility to users. Future enhancements may include advanced filters like transmission type, safety rating, and feature-based filtering. Technologies Used: - HTML: For creating filter options and UI elements. - CSS: For styling and responsive design. - JavaScript: For dynamic filtering and real-time updates. - Python (Flask): For backend processing and handling filter queries. - Database (MongoDB/MySQL): For fetching filtered car data efficiently. Overall, the Advanced Filtering Module enhances usability by allowing users to quickly and accurately find cars that match their requirements.
