

User Profile & Dashboard Module

The User Profile & Dashboard Module is responsible for managing and displaying personalized user information within the Smart Car Recommendation System. This module enhances user experience by providing a centralized interface where users can access their data, preferences, and activities. The User Profile section stores essential user details such as name, email, and preferences. Users can update their profile information whenever required. This ensures that the system always has accurate data for generating personalized recommendations. The Dashboard acts as a personalized control panel for the user. It displays saved cars (wishlist), recently viewed cars, and recommendation history. Based on user behavior and preferences, the system can also show customized car suggestions directly on the dashboard. This module also integrates with other components such as the recommendation engine and wishlist system, allowing seamless interaction across the platform. Users can quickly navigate between saved items, comparisons, and suggestions without repeating actions. Additionally, the dashboard improves usability by presenting data in a clean and organized manner, helping users make faster decisions. Technologies Used: - HTML: For structuring the dashboard layout and profile pages. - CSS: For styling and creating a responsive and visually appealing interface. - JavaScript: For dynamic content updates and interactive dashboard features. - Python (Flask): For backend logic, handling user data, API requests, and session management. - Database (MongoDB/MySQL): For storing user profiles, preferences, and activity history. Overall, the User Profile & Dashboard Module provides a personalized and efficient user experience by organizing all user-related data in one place and supporting intelligent decision-making.
