

Wishlist / Favorites Module

The Wishlist / Favorites Module allows users to save cars they are interested in for future reference. This module enhances user experience by helping users keep track of selected cars without searching again. Users can add cars to their wishlist with a single click. These saved cars are stored in the user's account and can be accessed anytime from the dashboard. This makes it easy to revisit and review preferred options. The module also allows users to compare saved cars directly from the wishlist, helping in faster decision-making. Users can remove cars from the wishlist whenever required. This module is integrated with the user authentication system, ensuring that saved data is secure and personalized. It also interacts with the recommendation and comparison modules for seamless navigation. Future enhancements may include notifications for price changes, new offers, or similar car suggestions. Technologies Used: - HTML: For designing wishlist interface and buttons. - CSS: For styling and responsive layout. - JavaScript: For dynamic add/remove actions and updates. - Python (Flask): For backend logic, handling requests, and managing user data. - Database (MongoDB/MySQL): For storing user-specific wishlist data. Overall, the Wishlist / Favorites Module improves usability by allowing users to organize and manage their preferred cars efficiently, making the decision process smoother and more convenient.
